SUMMARY

I ship production AI systems by directing coding agents. Over four months in 2026 I designed, built and deployed **17 codebases (266 commits)** — including a multi-tenant WhatsApp AI agent platform on Cloudflare Workers, and an internal AI business operating system running two agents that my team uses daily.

I own everything around the code: system architecture, data modelling, API and credential setup, third-party integration, deployment and iteration. Claude Code writes the implementation under my direction. That division of labour is deliberate, and it is how I move from a business requirement to a live system in days rather than months.

HOW I WORK

- **Decompose** a business requirement into an architecture and a build plan before any code exists — schema, tenancy model, failure modes, and what "done" means.
- **Direct** AI coding agents through multi-component builds, reviewing and correcting output rather than accepting it.
- **Own the operational surface** end to end: environment and secret management, Meta app review and webhook verification, OAuth and service-account setup, migrations, cron scheduling, deploys and rollbacks.
- **Write reusable tooling** — internal scripts and command files that turn repeated work into one step, cutting build time and token cost on every subsequent project.

SELECTED BUILDS

WhatsApp AI Agent Platform — multi-tenant SaaS

TypeScript · Cloudflare Workers · Durable Objects · Supabase Postgres · 78 commits

- Architected a multi-tenant platform where onboarding a new client is a database insert, not a deployment — one codebase serves every account.
- Designed a **17-table Postgres schema with row-level security on every table** and 45 forward-only migrations under an expand-contract discipline.
- Used **Durable Objects** to hold per-conversation state: message debounce, duplicate suppression, human-handoff locking, and WhatsApp's 24-hour reply window.
- Encrypted per-client credentials with AES-GCM, versioned for rotation without downtime.
- Built a safety layer that detects distress and minor-user signals and escalates to a human instead of replying.
- Shipped with Vitest suites on the Workers runtime, GitHub Actions CI, and nightly backups.

DOMINIUS — internal AI business operating system

Next.js · TypeScript · Upstash Redis · Google Apps Script · 85 commits · in daily use

- Built a **13-module** command centre unifying sales pipeline, lead prospecting, delivery tracking, daily planning and finance.
- Shipped **two production AI agents**: a WhatsApp lead qualifier, and a finance agent tracking capital, runway and burn from live transaction data.
- Integrated Meta WhatsApp Cloud API webhooks, Google Sheets and Calendar bridges, Redis-backed sessions, edge-middleware auth, and scheduled cron jobs for follow-ups and backups.

WhatsApp AI Sales Agent — productised across 10 verticals

Node.js · Meta Cloud API · OpenAI · Google Workspace · 31 commits

- Built a lead-qualification agent that converses in **English, Hinglish and Gujarati**, captures structured lead data, and books site visits directly into Google Calendar.
- Packaged it as a template: a new deployment needs **credentials and config only, zero code changes**, with a documented five-step setup and a terminal simulation harness for testing without WhatsApp.
- Adapted the same architecture across **10 verticals** — real estate, driving school, pathology lab, salon, spa, gym, education, automobile, clinic and tourism — including a medical-advice refusal guardrail for the clinical variant, and a Python/Flask build handling payment screenshots, document collection and PDF admission-form generation.

Supporting Builds

- **Real-estate brokerage OS** — SQLite (WAL), numbered migrations, PWA with service worker, three AI inference tiers, separate desktop/mobile interfaces per user role.
- **Two CRM tiers** — a SQLite self-host build with test coverage, and a Postgres build with TOTP two-factor authentication, QR enrolment and audit logging.
- **Offline-first expense-splitting PWA** — React, Dexie/IndexedDB and Supabase realtime with an offline write queue and conflict resolution.
- **Daily music automation** — Python service with a self-tuning taste model across 23 languages, scheduled via launchd, learning from listening feedback.
- **Websites** — logiclovingmind.com (Next.js); a tour operator's site rebuilt as a single dependency-free page with a Three.js 3D animation; a WebGL portfolio with a scroll-synchronised camera rig.

TECHNICAL SURFACE

Platforms	Cloudflare Workers, Durable Objects, Vercel, Render, GitHub Actions
Data	PostgreSQL, Supabase, SQLite, Redis, schema design, migrations, row-level security
Integrations	Meta WhatsApp Cloud API, Google Sheets/Calendar/Apps Script, OAuth, webhooks
AI	LLM agent design, prompt engineering, tool/function calling, Claude Code
Stack	TypeScript, Node.js, Python, React, Next.js, Tailwind
Practice	Git, environment and secret management, testing, CI, debugging production systems

I read, debug and direct changes across these stacks. Implementation is AI-assisted by design — I am not claiming to write production code unaided, and I would rather be judged on the systems I have shipped.

BUSINESS DEVELOPMENT

Ran approximately **300 outreach conversations** and **20–30 product demonstrations** across five verticals — salons, education, spas, gyms and real estate. Every build above came from watching an actual manual process and scoping the automation against it. Comfortable explaining technical systems to non-technical business owners.

EDUCATION

Self-directed, 2026 – present. Full-stack web development, LLM application architecture and business automation, learned by shipping rather than coursework. Comfortable going from unfamiliar API documentation to a working integration within a day.

G.D. Shah High School, Jamnagar — GSEB Secondary (10th), 2011

ADDITIONAL

Languages — Hindi (native), Gujarati (native), English (professional working)
Product and interface design · Video editing · Mac/PC systems troubleshooting
